1.0 SCOPE

1.1 Content

1.1.1 This specification describes the methods and tooling for the installation of Amphenol TCS Paladin Stacker press-fit Daughtercard onto a printed circuit board (PCB). See Appendix A for the press recommendations and process recommendations.

2.0 REFERENCE DOCUMENTS

- 2.1 Amphenol TCS Documents
 - TB-2324 General Product Specification for Paladin Interconnect System
 - TB-2322 Paladin Routing Guidelines
 - TB-2320 Paladin Direct Ortho General Guidelines
 - TB-2369 Paladin Stacker Daughtercard Module Removal and Replacement
 - TB- 2333 Paladin Backplane Removal and Reinsertion Process

3.0 TOOLING

Press System

The application of Amphenol TCS Paladin press-fit style components can be performed across many different press platforms, however there are minimum performance features and capabilities that are strongly recommended to be available:

3.1..1 Force Requirement

The Paladin Stacker daughtercard connector can be assembled using individual segments up to:

- 8 inches for 2, 3, and 4 pair connectors
- 6 inches for 5, 6, 7, and 8 pair connectors

Segments may be joined after individual pressing to total over 18" in length. Typically, Paladin compliant pins will require an insertion force of 1-6 lbs/pin. The press must have the capability of installing connectors with a maximum force of 6 lbs per pin. ATCS recommends using an ASG MEP 12T electric press for installing daughtercard connectors. Air or hydraulic presses are typically not as well suited for

controlled press rate and controlled force for daughtercard connector installations.

3.1..2 Rate

Recommended press head installation rate is 0.05 +/- .01 in/sec with the appropriate installation force.

3.1..3 Structure

The press, fixture, and tooling combination need to be adequately rigid such that there is a minimum deflection during the pressing process, and the forces are transmitted directly to the connector without inducing any side load or moment onto the connector assembly. The press also needs to be capable of applying a pre-load force minimum of 100lbs, and dwelling at that Z-height for approximately 1-2 seconds. This allows the press system to stabilize prior to actual insertion.

3.1..4 Feedback

The application press should have the capability to monitor, display, record, and feedback insertion force data to the Z axis speed controller throughout an individual press cycle. This capability allows for continuous insertion process monitoring, technical analysis and data collection in the event of a failure, and will alert the operator in the case of a mechanical machine problem. Speed or height controls should also allow a temporary press cycle stop at a repeatable position with reference to the board surface, or with reference to the insertion force. This ability is a requirement in certain connector and board combinations.

Application Tools

Paladin Stacker daughtercard connectors have dedicated loading heads for each product type and size. There are different loading head lengths available for each daughtercard product (refer to 3.1..1.1- 3.1..1.2) Amphenol TCS recommends that customers and contract manufacturers purchase the loading head tooling from ATCS to ensure proper clearances for the daughtercard installation.

Figure 1: 6 Pair Daughtercard Application Tool

3.1..1.1 Paladin Stacker 4 Pair Application Tools 694-0007-000-4-Pair Daughtercard Loading Head 1.2" Long 644-0008-000-4-Pair Daughtercard Loading Head 2.0" Long 644-0009-000-4-Pair Daughtercard Loading Head 4.0" Long 644-0010-000-4-Pair Daughtercard Loading Head 6.0" Long 644-0011-000-4-Pair Daughtercard Loading Head 8.0" Long 644-0012-000-4-Pair Daughtercard Loading Head 10.0" Long

• Support Tooling/Fixture

Customers and contract manufacturers should design or purchase the appropriate support fixture to support the PCB during the daughtercard installation process. Support fixtures are to provide adequate support for the required number of pins being pressed directly under the connector pattern. The support fixture should also be designed to accommodate for the compliant pin lead protrusion on the secondary side of the PCB. Refer to Paladin Stacker daughtercard customer use drawings for the compliant pin lead protrusion dimensions. The support fixture is not supplied by Amphenol, if assistance with the fixture design is needed please contact your local field application engineer.

4.0 PROCEDURE

- Step 1. Locate the correct seating head and support pallet/fixture.
- Step 2. Place the support fixture (pallet) onto the press bed, and ensure:
 - Pallet is square with reference to the press head.
 - Pallet is flat to the press bed, with no excessive bow or twist.
 - PCB is pinned to the pallet.
 - Pallet is pinned to the press bed.
- Step 3. Ensure the press has the required installation force, alignment, and speed controls capable of pressing the specific configuration connector being installed. Refer to section 2.2.1 for details.
- Step 4. Place the PCB onto the pallet and remove the connector from the packaging. If the connector is supplied in a tray, simply remove the cover and lift the connector from the tray. If the connector is supplied in a tube, first remove the shipping tape and hardware. Lay the tube on a flat table with the connector compliant pins facing up. To properly remove the connectors from the tube, use a round or square rod to push the connectors out one at a time.

Step 5. Verify the compliant pins of the connector were not damaged or bent during shipping or removal from the packaging. Visually inspect for bent pins, looking down both the width and length of the connector pin pattern for any grossly misaligned pins. If a compliant true position gage has been ordered, place the connector onto the gage in the same manner as the connector would be placed onto a PCB, and look for any difficulty during placement, or any compliant pins that do not protrude out the back side of the gage. If any compliant pins are out of position or broken, discard the connector and begin Step 5 again with a new connector.

NOTE: Amphenol TCS recommends the purchase or the design and manufacture of a daughtercard compliant pin true position gage for the specific configuration of the connector being installed. The compliant pin true position gage can ensure that the compliant pins are in their proper position immediately before the connector is placed onto the board, significantly reducing the possibility of connector or PCB damage. Contact your local Amphenol TCS application engineer for ordering information of this part.

Step 6. When placing the daughtercard connector on the PCB, orient the board and pallet so when the connector is placed, the window side will be facing you and the stiffener side will be facing away from you. Hold the connector up off the PCB, and place the back row of compliant pins into the correct plated through hole (PTH), see Figure 2. With the front of the connector still up off the board, roll the connector back to front, into the remaining PTHs (see Figure 3). Ensure that the visible compliant pins of the connector perimeter are properly preloaded into the PTH (see Figure 4 and Figure 5).

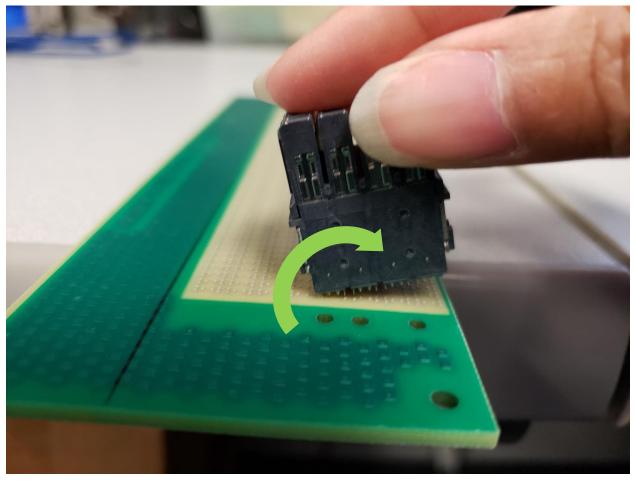

Figure 2: With the back row entirely placed, roll connector toward board edge placing the remaining rows of compliant pins.

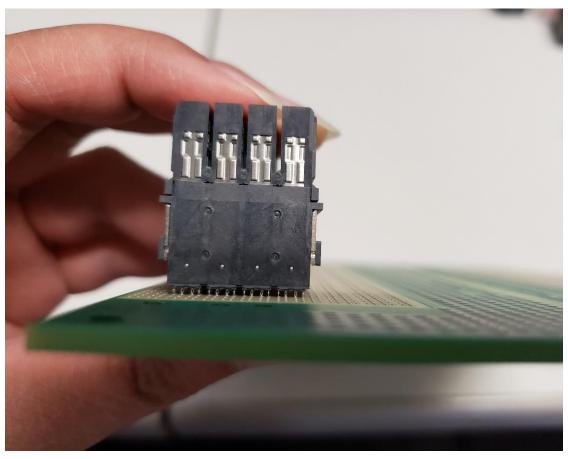

Figure 3: Side view of the assembly. Check for bent pins.

Figure 4: Pre-loaded view of the assembly. Check for bent pins.

Step 7. Select the correct seating head based on the connector type and the length of the connector. Ensure the seating head at a minimum is the same length as the connector (see Figure 6). Position the seating head directly on top of the connector, ensuring the clearance slot is over the wafer "retention hats" and the rear alignment rib is against the stiffener back (see Figure 5).

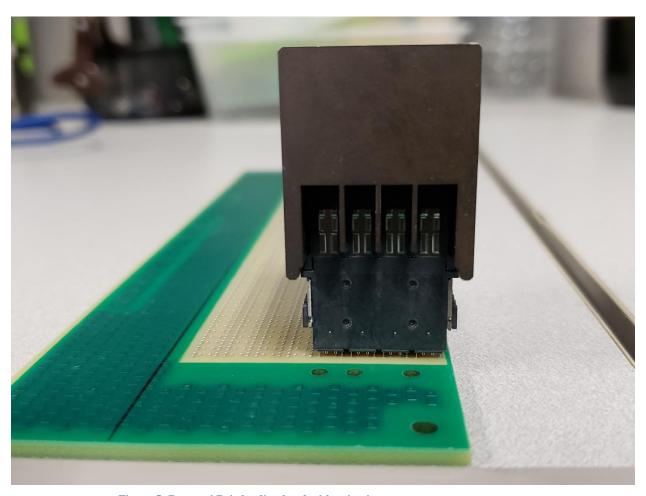

Figure 5: Proper 4 Pair loading head with a 4 pair connector.

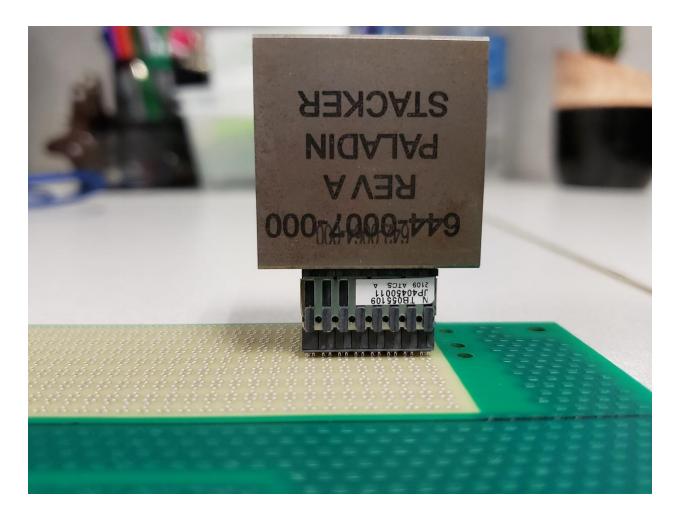

Figure 6: Ensure that the load head length is equal to or greater than the connector length.

NOTE: Ensure the seating head does not contact any other components on the PCB adjacent or behind the connector throughout the placement and pressing process. See the Paladin Stacker Removal and Replacement Spec (TB-2369) for rework keep out zones.

- Step 8. Initiate the press cycle and seat the connector onto the board surface.
- Step 9. Visually identify the plastic standoff on the stiffener side of the connector, contacting the board surface. This standoff cannot be more than 0.125mm from the board surface, and there should be minimal visible difference in height between adjacent wafers (see Figure 8).

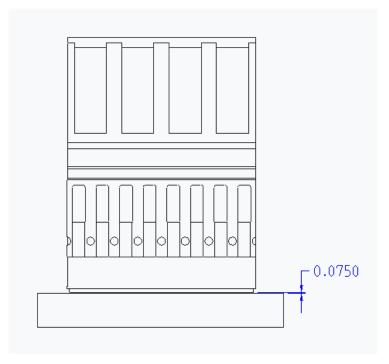

Figure 7: 0.075 mm maximum height off board surface

Step 10. If the PCB thickness allows, inspect the connector pattern from the secondary side, and verify the presence of a compliant pin tip in each PTH.

Appendix A Paladin Stacker Daughtercard Press Recommendations and Pressing Procedures

Paladin Stacker Daughtercard Press Recommendations

The press used for inserting Paladin Stacker daughtercard connectors into the PCB should have the minimum capabilities defined as follows:

- 1) The press shall be suitably rigid to provide a stable platform to support the installation of any size connectors. Installation forces will vary depending on connector size, plated through hole size, and plated through hole finish. The press, tooling and fixtures need to be sufficiently rigid to prevent any bowing or deflection during the installation process.
- 2) ATCS recommends a press that has the capability to apply a pre-load force of approximately 100lbs and dwelling at that force for approximately 1-2 sec. This allows the entire press setup to stabilize just prior to inserting the connector into the plated through hole. This pre-load force eliminates any bow that might exist in the PCB and firmly seats the connector into the PTH just prior to the installation process.
- 3) The press shall be capable of controlling the insertion rate. ATCS recommends an insertion rate of 0.050 in/sec to ensure the compliant pins are properly inserted into the PTH and reduces any damage to the PTH.
- The press shall be capable of a pressing process per a force gradient curve. To do this, the press must have real time force feedback from the press head and the necessary software, this allows for consistent daughtercard connector installation and accounts for PCB thickness and connector height tolerances. It is not recommended to insert daughtercard connectors to a specific height, due to the PCB and connector tolerances build up. Installing a daughtercard connector to a specific height may result in over seating or under seating the connector. Over seating a daughtercard connector can cause damage to the connector and/or the PCB. Under seating the connector will not fully insert the compliant pin into the PTH and can cause mechanical and reliability issues.
- 5) ATCS recommends that each connector be pre-loaded, then pressed, before continuing to the next connector. It is not recommended to pre-load more than one connector at a time.

NOTE: Amphenol TCS recommends using the Tyco Electronics (ASG) MEP-12T for all Paladin connector pressing. The MEP-12T has all of the capabilities outlined above.

Paladin DC Recommended Press Procedures

The following are recommended process steps to follow when installing Paladin Stacker DC connectors.

- 1) Each PCB should be inspected for blocked holes. This can be accomplished by simply holding the board up to a light and visually looking at the connector plated through hole (PTH) pattern for any holes that are not clear. This ensures that the connector will insert and seat properly into the PCB.
- Each PCB should be inspected for the finished hole size (FHS). Compliance to the required FHS is important in maintaining a consistent pressing process, refer to TB-2322 for FHS requirements. Approximately 6-12 holes should be inspected across the connector hole pattern.
- 3) After pressing, the completed assembly should be inspected.
 - a. First, inspect the PCB opposite the connector to verify that the compliant pins are in the holes. If a pin is missing the assembly can be repaired by removing the defective daughtercard module and inserting a new one per TB-2327. The most common cause of a missing pin is improper loading of the connector, which causes a bent pin prior to pressing.
 - b. Second, inspect the connector from the press-fit side of the PCB. Confirm that all plastic standoffs on both the front and back of the connector (either side of compliant pin field) are seated evenly against the PCB along the length of the connector. The standoffs can be as much as 0.125mm (0.005") maximum above the PCB surface, but should be even across the connector. Connectors may be repressed if found to be not properly seated. The plastic standoffs should not be cracked, deflected, or otherwise damaged, as a result of overpressing.

For customers who are using an MEP 12T press, please contact your local ATCS application engineer for tooling and fixturing support.

Paladin DC Recommended Press Settings for Tyco (ASG) MEP-12T Presses

The following settings are recommended for applying Paladin connectors using MEP-12T presses. If the press is not an MEP-12T, please contact your ATCS application engineer for assistance.

Figure A-1: MEP-12T Manual-Electric Press.

Amphenol-TCS has developed a press profile that can be used on MEP presses to install Paladin connectors onto PCBs. The profile utilizes force feedback features on the MEP-12T press that ensure proper pressing of connectors. The Paladin press profile developed by Amphenol-TCS is named: *ATCS_FEMTO_FG_DWELL.prf*

• If this profile is not installed on your press, please contact your ATCS fields application engineer for assistance. Other profiles tailored to specific connector and application needs may also be used, consult your ATCS fields application engineer for more information and assistance.

The following steps describe proper creation, setup, and application of Paladin Daughter Card connectors: The MEP press main menu has 4 major screens that are required to setup a connector, tool and PCB for pressing (See Figure A-2):

• 1 - Tool Editor

This screen is where the tool name, ID, and dimensions are entered.

• 2 - Connector Editor

This screen is where connector name, dimensions, pin count, error limits, and termination method are entered.

• 3 - Profile Editor

This screen is where the list of action steps for the press to execute is entered (the *ATCS_FEMTO_FG_DWELL.prf* profile)

• 4 - Press Data Editor

This screen is where a PCB is assigned connectors to be pressed, board thickness, and fixture thickness.

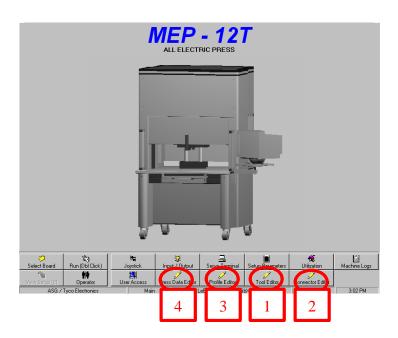

Figure A-2: Main Menu of MEP-12T Press.

1 - Tool Editor:

The Tool Editor screen allows for the creation of a new tool (See Figure). This screen is the setup for top tooling only. Bottom tooling setup is in the press data editor screen and is categorized as "Fixture" (See Press Data Editor Screen). See Table 1 for load head height dimensions.

- Tool Type Unique identifier (User specified).
- Tool ID Tool part number (User specified).
- Tool Clearance Typically 0.100 inches unless additional height is needed for taller components on PCB.
- Tool Height Overall height of tool from top of tool to tool contact point of connector.
- Tool Width Width of tool.
- Tool Length Length of tool.

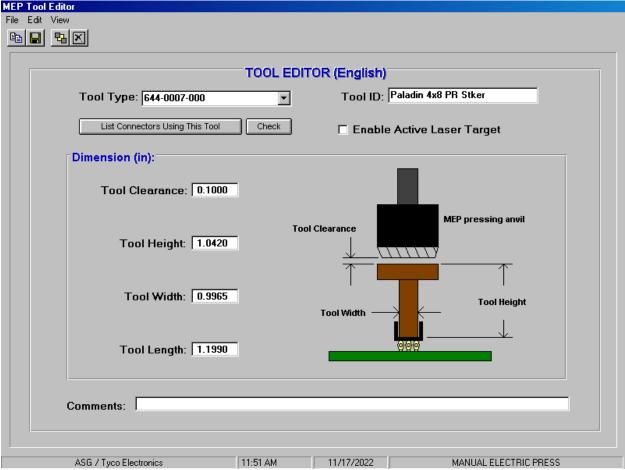

Figure A-3: Tool Editor Screen of MEP-12T Press. (Representative screen – tool length can vary based on connector configuration)

Connector Size	Tool Length (inches)	Tool Height¹ (inches)	Tool Width ² (inches)
4 Pair	1.20	1.04	1
6 Pair	1.20	1.04	1

- 1. Tool height is measured from the press ram surface to the tool surface that touches the connector
- 2. Tool width will vary depending on connector configuration

Table 1: Load head tool height.

2 – Connector Editor:

The Connector Editor screen allows for the creation of a new connector (See Figure). Table 2 depicts the various connector inputs for the connector editor for all Paladin sizes.

- Connector Part number for connector being created (User specified).
- Tool "Tool Type" and "Tool ID" from Tool Editor screen.
- Profile Pressing profile used by the MEP-12T to install the Paladin connector (Amphenol-TCS recommendation is *ATCS_FEMTO_FG_DWELL.prf*)
- Number of Pins Sum of all pins entering PTHs on the connector (signal, shield, and power).
- Graph Scale 6.0 for Paladin Femto Pin (0.0157" Drill) Daughter Card
- Distance 0.08"
- Min Force / Pin − 0.3lb
- Max Force / Pin 6.0 for Paladin Femto Pin (0.0157" Drill) Daughter Card
- User Force / Pin Not used for *ATCS_FEMTO_FG_DWELL.prf* profile.
- Other Force Not used for *ATCS_FEMTO_FG_DWELL.prf* profile.
- PARS Not used for ATCS_FEMTO_FG_DWELL.prf profile.
- Force Gradient Degrees 70.0.
- SPC Values to be dictated by process owner. Not covered in this document.
- Dimension Unique to connector being installed.

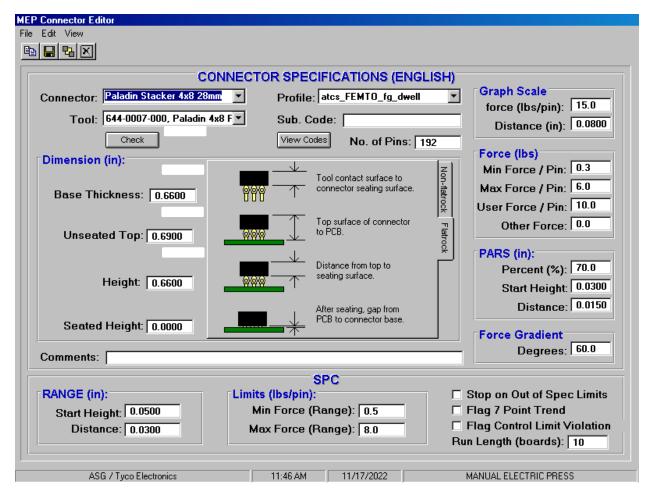

Figure A-4: Connector Editor Screen of MEP-12T press.

The dimensions of connectors that are critical to proper installation onto a PCB are:

- Base Thickness The connector thickness between the contact point of the installation tool and the seating surface of the connector. This dimension is taken from the stiffener hat surface.
- Unseated Top The unseated connector height from the contact point of the installation tool to the PCB surface.
- Height Same as Base Thickness for Paladin Connectors.
- Seated Height Gap between PCB and connector seating surface, ideally 0.00".

	Base Thickness	Unseated Top ¹		
Connector Size	(inches)	(inches)	Height ¹	Seated Height
All Connectors 18 mm	0.266	0.306	0.266	0
All Connectors 22mm	0.42	0.72	0.42	0
All Connectors 28mm	0.66	0.69	0.66	0
All Connectors 30mm	0.74	0.77	0.74	0
All Connectors 32mm	0.82	0.85	0.82	0
All Connectors 34mm	0.90	0.93	0.90	0
All Connectors 36mm	0.974	1.004	0.974	0
All Connectors 38mm	1.05	1.08	1.05	0
All Connectors 40mm	1.13	1.17	1.13	0
All Connectors 44mm	1.29	1.33	1.29	0
All Connectors 48mm	1.45	1.49	1.45	0

^{1.} Can Vary based on PTH finished hole size

Table 2: Connector editor information for all Paladin Stacker connector sizes.

3 – Profile Editor:

The Profile Editor screen provides the detail of the Amphenol-TCS *ATCS_FEMTO_FG_DWELL.prf* profile created for installing Paladin connectors onto PCBs (See Figure). Rows 1 through 5 are the commands for a normal press sequence. Rows 6 through 9 are the commands for a "Re-Press" sequence. At each step in the profile sequence, the press executes on the event that occurs first. If the "Height Above Board" occurs first, then the press executes the "Height Action". If the "Force" occurs first, the press executes "Force Action".

The press speed during the press sequence is set to 0.050 inches / second. This speed is intended to ensure that the Paladin compliant pins remain stable during the pressing process. Speeds exceeding this are not recommended, and may result in connector pressing failures. Row 3 has a 3.0 second delay built into the press profile as a settling time for connectors to minimize the potential for pressing failures.

- Profile Set of steps found in *ATCS_FEMTO_FG_DWELL.prf* profile to perform normal press and re-press operations for Paladin connectors
- Sample Range for PARS Forces Not used in ATCS FEMTO FG DWELL.prf profile.
- Action Errors Messages that appear on MEP-12T monitor if error occurs.

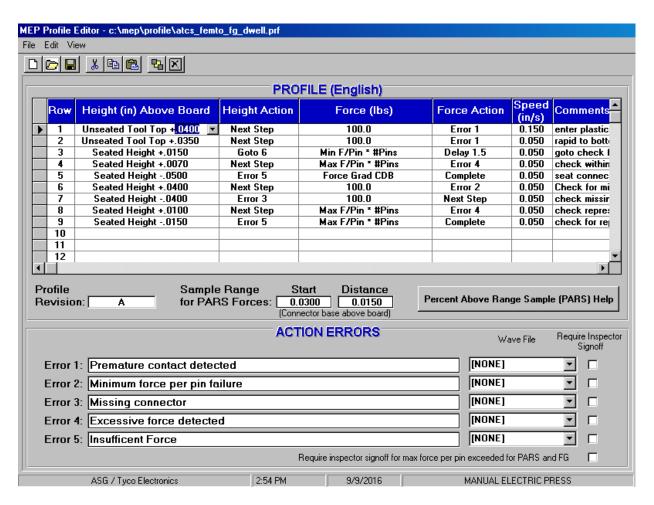

Figure A-5: Profile Editor of MEP-12T press displaying the Amphenol TCS ATCS_FEMTO_FG_DWELL.prf profile, Revision A.

4 – Press Data Editor:

The Press Data Editor screen allows for the creation of a unique PCB assembly (See Figure).

- Description Unique identifier of assembly (User specified).
- Revision To be determined by process owner (User specified).
- Board Thickness Thickness of raw PCB in inches in the location of the Paladin connector. This value may be determined by a board thickness measurement taken automatically prior to press cycle (not covered in this document).
- Fixture Thickness Thickness of bottom fixture or pallet. This thickness includes any tooling between "machine zero" and the bottom surface of the PCB. "Machine zero" is the original press table top, or may be reassigned as the top of a permanent bottom fixture or rolling table.
- Fixture ID To be determined by the process owner (User specified).
- Press Sequence Connector pressing order to be determined by process owner.
 - X, Y, and Angle Locations of the connector being placed on PCB. To be determined by process owner.
 - o Connector Select Paladin connector from pull down menu in "Connector" cell.

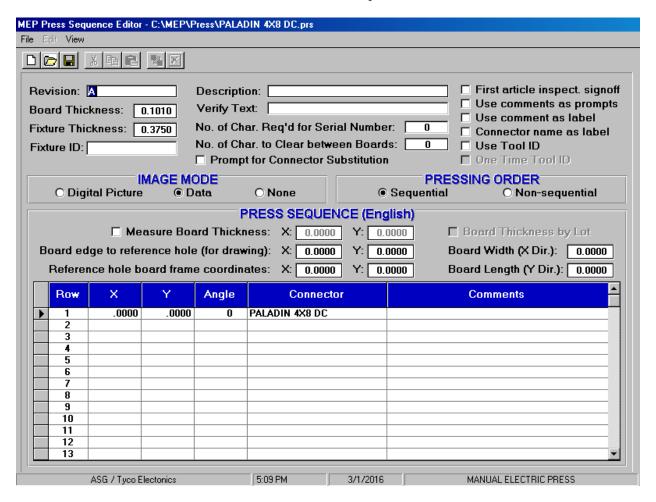

Figure A-6: Press Data Editor of MEP-12T press.

The MEP-12T press produces a Force vs. Distance curve during a pressing sequence similar to the one shown in **Error! Reference source not found.** The main areas of the curve are: the initial compression of the Paladin compliant pin and compliance of the PCB hole (1), the point of maximum deflection of the Paladin compliant pin (2), the sliding of the compliant pin in the PCB hole (3), and the termination force of the pressing sequence at the 75 Degree Force Gradient line (4). The following descriptions of these areas are for reference and are intended as an aid in understanding the pressing characteristics of the Paladin connector utilizing the *ATCS_FEMTO_FG_DWELL.prf* profile.

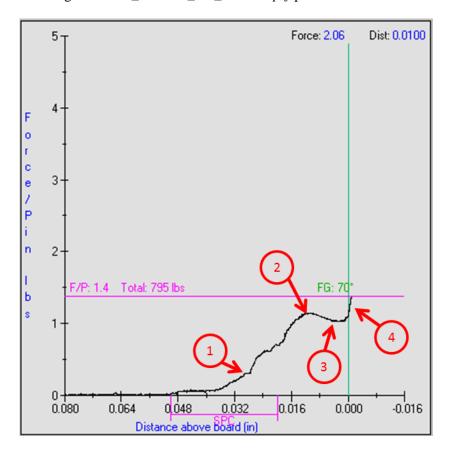

Figure A-8: Typical Force vs. Distance Curve of MEP-12T press for Paladin connectors.

1 – Initial Compression of Paladin compliant Pins:

Part of the initial pressing sequence with the *ATCS_FEMTO_FG_DWELL.prf* profile (Refer to Figure) is to permit settling and alignment of all the compliant pins of the connector prior to a full pressing sequence. In this zone, the Paladin compliant pins and the PCB plated through holes begin to conform to each other and the Paladin compliant pins begin to compress. At this zone the slope of the force gradient line begins to increase as the Paladin compliant pins continue to compress.

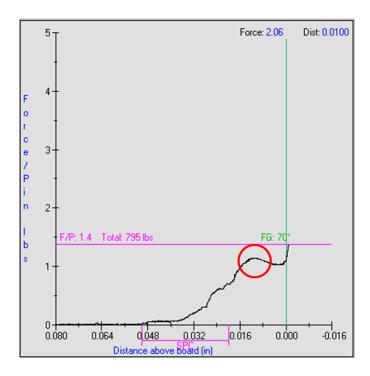

Figure A-9: Paladin pressing Force vs. Distance Graph showing two shapes of the knee area utilizing an MEP-12T press.

2 – Full collapse of the Paladin compliant pin:

At approximately 0.010"-0.015" above the PCB surface (0.000" on the X-Axis), the Paladin compliant pin is fully collapsed in the PCB plated through hole. This is represented by the peak in the force gradient curve, referred to the knee of the curve. Depending on multiple variables including PCB surface finish, PCB hole diameter, compliant pin feature size, number of power pins vs. signal pins, etc., the knee will be more or less pronounced, but is typically highlighted by an inflection point in the curve as Figure A-8 shows.

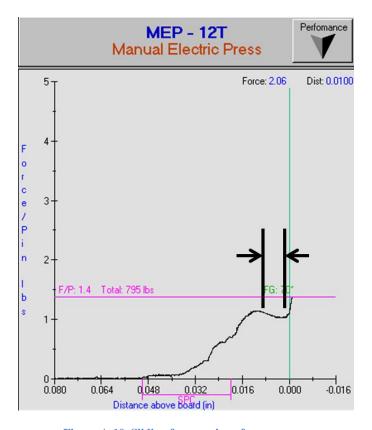

Figure A-10. Sliding force region of press curve.

3 – Sliding Force of the Paladin compliant pin in the PCB hole:

After the compliant pin of the Paladin connector is fully compressed, the pin travels further into the PCB plated through hole. As this sliding occurs, the force required to continue the installation process of the Paladin connector past this point may decrease between 1 and 30 percent for a short distance before beginning to increase again as the compliant pin travels further into the PCB plated through hole. The specific amount of decrease depends on multiple variables including PCB surface finish, PCB hole diameter, compliant pin feature size, number of power pins vs. signal pins, etc.

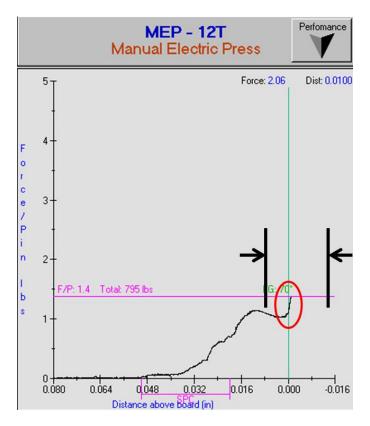

Figure A-11. Press sequence force gradient termination.

4 – Termination Force at the 70 Degree Force Gradient Line:

Once the Paladin connector standoff and organizer features begin to come in contact with the PCB surface, the force vs. distance curve will begin to increase in slope. During this stage of the pressing sequence, the $ATCS_FEMTO_FG_DWELL.prf$ profile is designed to begin to search for the force vs. gradient curve to reach a 70 degree angle at a distance from 0.010 inches above to 0.015 inches below the PCB surface (See Profile Editor and Press Data Editor Sections). Once the connector standoff features come in contact with the PCB surface, the connector is fully seated (flush to 0.075 mm above PCB surface, refer to Figure 7). Figure A-10 shows the termination phase of the pressing process.
